## AMENDMENTS TO THE CLAIMS

## Please amend Claims 4-9, 15-17, and 21 as follows.

- 1. (Original) A method of manufacturing a two-colored particle, comprising: a step of making a single liquid droplet by contacting together, within air or within a liquid, a first liquid droplet which has a first hue, and a second liquid droplet which has a hue which is different from the first hue; and a step of contacting said single liquid droplet with a reaction liquid so as to harden it instantaneously.
- 2. (Original) The method of manufacturing a two-colored particle according to claim 1, wherein electric charges of said first liquid droplet and of said second liquid droplet are different.
- 3. (Original) The method of manufacturing a two-colored particle according to claim 1, wherein, while the electric charge of said first liquid droplet and of said second liquid droplet is the same, electric charge density is different.
- 4. (Currently Amended) The method of manufacturing a two-colored particle according to any one of claims 1 through 3, further comprising a step in which said two-colored particle which has been made is dried, and in which it is arranged that the masses, within said two-colored particle after drying, of a portion which originates in said first liquid droplet and of a portion which originates in said second liquid droplet are different.
- 5. (Currently Amended) The method of manufacturing a two-colored particle according to any one of claims 1 through 3, wherein said first liquid droplet and said second liquid droplet are both ones which include reactive components, and further comprising: a step in which said two-colored particle which has been made is dried, and a step of dissolving and eliminating a reaction product on a surface of said two-colored particle.

Appl. No. : Unknown Filed : Herewith

6. (Currently Amended) The method of manufacturing a two-colored particle according to any one of claims 1 through 3, wherein said first and second liquid droplets are manufactured using a spray nozzle.

- 7. (Currently Amended) The method of manufacturing a two-colored particle according to any one of claims 1 through 3, wherein said first and second liquid droplets are manufactured using an ink jet nozzle.
- 8. (Currently Amended) The method of manufacturing a two-colored particle according to any one of claims 1 through 3, wherein at least one of said first liquid droplet and said second liquid droplet includes a pigment.
- 9. (Currently Amended) The method of manufacturing a two-colored particle according to any one of claims 1 through 3, wherein said first liquid droplet and said second liquid droplet include an electrification control substance.
- 10. (Original) A method of manufacturing a particle, comprising: a step of, using a plurality of liquid droplets, combining a metal into at least one liquid droplet; a step of contacting together said plurality of liquid droplets within air or within a liquid and making them into a single liquid droplet; and a step of contacting said liquid droplet which has become single with a reaction liquid so as to harden it instantaneously.
- 11. (Original) The method of manufacturing a particle according to claim 10, wherein said metal is a magnetic substance.
- 12. (Original) The method of manufacturing a particle according to claim 10, wherein, in said particle after it has hardened, among colors of portions which originate in said plurality of liquid droplets, the color of a portion which originates in at least one liquid droplet is different from the color of a portion which originates in another liquid droplet.

Appl. No. : Unknown Filed : Herewith

- 13. (Original) A display element which includes a two-colored particle, insulating oil, and a microcapsule enveloping said two-colored particle and said insulating oil, wherein said two-colored particle is manufactured by a method comprising: a step of making a single liquid droplet by contacting together, within air or within a liquid, a colored first liquid droplet, and a second liquid droplet which has a color different from said first liquid droplet; and a step of contacting said liquid droplet with a reaction liquid so as to harden it instantaneously.
- 14. (Original) The display element according to claim 13, wherein said two-colored particle within said microcapsule is rotated by an electric field.
- 15. (Currently Amended) The display element according to claim 13 or claim 14, wherein a single said two-colored particle is enveloped in a single said microcapsule.
- 16. (Currently Amended) The display element according to claim 13 or claim 14, wherein at least two of said two-colored particles are enveloped in a single said microcapsule.
- 17. (Currently Amended) The element for display according to claim 13 or claim 14, wherein said insulating oil includes a surfactant.
- 18. (Original) A method of manufacturing a display sheet, comprising: a step of applying a releasing substance on surfaces of two-colored particles having hemispheres of different color; a step of dispersing said two-colored particles within a matrix resin so as to form a sheet; and a step of soaking said sheet in an insulating oil and dissolving said releasing substance, so as to provide voids filled with the insulating oil between said two-colored particle surfaces and said matrix resin.
- 19. (Original) The method of manufacturing a display sheet according to claim 18, wherein said releasing substance is a polyolefin type material.

Appl. No. : Unknown Filed : Herewith

- 20. (Original) The method of manufacturing a display sheet according to claim 19, wherein said polyolefin type material is a paraffin wax.
- 21. (Currently Amended) The method of manufacturing a display sheet according to any one of Claims 18 through 20, wherein said matrix resin is a silicone elastomer.
- 22. (Original) The method of manufacturing a display sheet according to claim 21, wherein said silicone elastomer is a normal temperature hardening type elastomer.
- 23. (Original) The method of manufacturing a display sheet according to claim 21, wherein hardening temperature of said silicone elastomer is a temperature which is lower than a melting point of the releasing substance.
